

Synergistic Design

Class 2 **“Jupiter”** - gas planet, has at least 67 moons” A **Design** featuring multiple containers (minimum 3) to be staged on a black triangular platform 24” high and sides of top each 30” in length. Design to be viewed from all sides. Height of design unlimited. Designer’s Choice of materials.

Here is a photo showing the black triangular platforms set on the stage as they will be for the synergistic design. You can see how important it is for the design to have considerable height to balance the weight and height of the platforms. The designer will have to give much thought to how their design will be supported and achieve dramatic height. One idea we have had is that the sets of 4 black frames owned by the club could be made available for this de-

In the designs that follow, all except one are set directly on a table surface. Imagine how they would have another dimension if the units were not all on the same level!

All the units relate to each other by using the same plant materials. Notice that each unit is incomplete on its own, but together they make a whole design. Some of the units have a connecting vine, stem coil to further help the design cohere.
